For any help, Email or Contact the organisations.

Doctor's name:Doctor2

Patient's name:Shreya Seth

Speciality:General Health Checkup

Patient's contact:9415764001

Prescription:

For a fever, sore throat and headache, adults often turn to OTC acetaminophen (Tylenol, others) or other mild pain relievers such as ibuprofen (Advil, Motrin IB, others). For treatment of fever or pain in children, consider giving your child infants' or children's over-the-counter fever and pain medications such as acetaminophen (Tylenol, others) or ibuprofen (Advil, Motrin, others). These are safer alternatives to aspirin. For children younger than 3 months old, don't give acetaminophen until your baby has been seen by a doctor. Don't give ibuprofen to a child younger than 6 months old or to children who are vomiting constantly or are dehydrated. Use these medications for the shortest time possible and follow label directions to avoid side effects. Call your doctor if you have questions about the right dose. Aspirin is not recommended for children or teenagers. Though aspirin is approved for use in children older than age 3, children and teenagers recovering from chickenpox or flu-like symptoms should never take aspirin. This is because aspirin has been linked to Reye's syndrome, a rare but potentially life-threatening condition, in such children.
